SUMMARY

Unity developer with 16 shipped mobile titles, and game feel is the part I care about most. My strongest skills are core gameplay mechanics, performance on low-end devices, and the editor tools designers work in.

CORE SKILLS

- **Core:** C#, Unity 6 and 2022 LTS, OOP, SOLID, clean architecture, Git
- **Architecture:** Dependency Injection (Zenject, VContainer), MVC/MVP, reusable module design, custom Unity Editor tools
- **Unity:** UniTask, DOTween, Addressables, MessagePipe, URP, shaders (vertex animation, Shader Graph), Odin Inspector
- **Monetization & analytics:** Firebase (Analytics, Remote Config), AppsFlyer, ad mediation (AppLovin, Unity Ads), IAP (including Amazon Subscriptions)
- **Performance:** Android optimization on low-end devices (draw calls, memory, build size, startup time); Unity Profiler, Memory Profiler, Frame Debugger

WORK EXPERIENCE

Unity Developer / Self-employed

September 2025 - present

- Built an HTML5 playable ad in one week, my first time shipping to the web: 800 units on screen at 60 FPS on an Amazon Fire 7 (2019, 1 GB RAM), in 2.9 MB out of a 5 MB budget. One GameObject per unit only reached 10 FPS, so I baked the crowd into a custom vertex animation shader instead

Unity Developer / Vira Games

July 2022 - September 2025 | Remote

Mobile games studio, hyper-casual and hybrid-casual titles. Collaborated daily in one of several 3-person pods (game designer, artist, Unity developer) under a tech lead and producer. Carried each title from first playable to store release.

Selected work:

- Shipped 16 Android titles in 38 months on Google Play and Amazon Appstore, every one running on a 1 GB Fire 7
- Built the editor tools and content pipeline designers worked in: a level builder that cut colliders from ~50 to 5 per level, a branching dialogue editor, rope authoring, content generators
- Extended the studio's shared SDK used by every team: analytics and attribution events (AppsFlyer), an ad-mediation upgrade (CAS), a one-click Tenjin to AppsFlyer swap
- Rebuilt the biggest share of store builds when a store policy change put the studio's entire catalogue back through compliance
- Made a title successful enough that the studio reskinned it twice: built one reskin, mentored the developer on the other
- Built hybrid-casual meta systems: progression, in-game economy, battle pass, retention
- Picked by the tech lead for the studio's VR hackathon, playable build in two weeks

Selected shipped titles ***(all 16 in my portfolio)*****:**

- **Jelly Merge** - Cube-merging puzzle with a Lego-style cube-building meta; 4.5 stars from 1,400+ ratings on Amazon
- **Squishy Octopus** - Obi Rope stretch mechanic with a custom level editor
- **Cowboy Shooter** - Western shooter with IK-driven animation and cover-based AI

PERSONAL PROJECTS

- **Memory Foyer** (GitHub) - Unity 6 spaced-repetition trainer (SM-2), built in three weeks. Five-layer architecture compile-enforced via .asmdef; Domain and Application are pure C# (no UnityEngine), covered by 12 EditMode test suites. VContainer, UniTask, MessagePipe; in-editor deck-authoring tool.
- **ChessOutline** (GitHub) - Chrome extension for visualising chess tactics: pins, forks, hanging pieces, square control.

EDUCATION

Bachelor's in Computer Engineering / Taras Shevchenko National University of Kyiv

2020 - 2024 | completed alongside the full-time role at Vira Games

LANGUAGES

Ukrainian (native) | English (B2) | Danish (learning)
