## SUMMARY

---

Unity developer with 16 shipped mobile titles, and game feel is the part I care about most. My strongest skills are core gameplay mechanics, performance on low-end devices, and the editor tools designers work in.

## CORE SKILLS

---

- **Core:** C#, Unity 6 and 2022 LTS, OOP, SOLID, clean architecture
- **Architecture:** Dependency Injection (Zenject, VContainer), MVC/MVP patterns, reusable module design, custom Unity Editor tools
- **Unity ecosystem:** UniTask and Coroutines (async), DOTween, Addressables, MessagePipe, Universal Render Pipeline (URP), Cinemachine, TextMeshPro, Odin Inspector & Serializer
- **Monetization & analytics:** Firebase (Analytics, Remote Config), AppsFlyer, ad mediation (AppLovin, Unity Ads), IAP (including Amazon Subscriptions)
- **Performance:** mobile optimization (draw calls, memory, build size, startup time); Unity Profiler, Memory Profiler, Frame Debugger, Graphy
- **Workflow:** Git, AI-assisted development (Claude Code, Cursor)

## WORK EXPERIENCE

---

### Independent projects

*September 2025 - present*

- Built an HTML5 playable ad in one week, my first time shipping to the web: 800 units on screen at 60 FPS on an Amazon Fire 7 (2019, 1 GB RAM), in 2.9 MB out of a 5 MB budget. One GameObject per unit only reached 10 FPS, so I baked the crowd into a vertex animation instead
- Built Memory Foyer and ChessOutline, detailed below

### Unity Developer / Vira Games

*July 2022 - September 2025 | Remote*

Hyper-casual / hybrid-casual mobile game studio. Worked in one of several 3-person pods (game designer, artist, and one Unity developer) under a tech lead, producer, and art lead. Carried each title from first playable to store release.

#### Selected work:

- Built a title successful enough that the studio reskinned it twice - I built one reskin myself and helped the other developer match the same feel
- Rebuilt more store builds than anyone on the team when a policy change pulled every developer and tester off their own projects to bring the studio's entire catalogue back into compliance
- Optimized all 16 titles for the studio's floor device, the Fire 7, the constraint that decided which audiences the studio could sell to
- Built the tools the game designer worked in on almost every title, starting with my first commercial project: a branching dialogue editor, rope authoring, level builders, content generators
- Built nine different control mechanics into a single shipped title, composed from one hero prefab instead of nine rewrites
- Picked by the tech lead as his partner for the studio's internal VR hackathon, and we had a playable build in two weeks

#### Selected shipped titles (all 16 in my [portfolio](#)):

- [Jelly Merge](#) - Cube-merging puzzle with a Lego-style cube-building meta; 4.5 stars from 1,400+ ratings on Amazon
- [Squishy Octopus](#) - Obi Rope-based stretch mechanic with custom level editor
- [Cowboy Shooter](#) - Western shooter with IK-driven character animation and cover-based AI
- [Soap Slice](#) - Mesh cutting with my own pseudo-physics instead of PhysX

## EDUCATION

---

**Bachelor's in Computer Engineering** / Taras Shevchenko National University of Kyiv

2020 - 2024 | *completed alongside the full-time role at Vira Games*

Relevant coursework: computer architecture, operating systems, low-level programming (including assembly), and relational databases.

## PERSONAL PROJECTS

---

- **Memory Foyer** ([GitHub](#)) - Unity 6 spaced-repetition trainer (SM-2), built in three weeks. Five-layer architecture (Domain / Application / Infrastructure / Presentation / Composition) compile-enforced via .asmdef; Domain and Application are pure C# (no UnityEngine), covered by 12 EditMode test suites. VContainer, UniTask, MessagePipe; in-editor deck-authoring tool.
- **ChessOutline** ([GitHub](#)) - Chrome extension for visualising chess tactics (pins, forks, hanging pieces, square control) to help spot patterns while studying positions.

## LANGUAGES

---

Ukrainian (native) | English (B2)
