SUMMARY

Unity developer with 16 shipped mobile titles, and game feel is the part I care about most. My strongest skills are core gameplay mechanics, performance on low-end devices, and the editor tools designers work in.

CORE SKILLS

- **Core:** C#, Unity 6 and 2022 LTS, OOP, SOLID, clean architecture, Git
- **Architecture:** Dependency Injection (Zenject, VContainer), MVC/MVP, reusable module design, custom Unity Editor tools
- **Unity:** UniTask, DOTween, Addressables, MessagePipe, URP, Odin Inspector & Serializer
- **Monetization & analytics:** Firebase (Analytics, Remote Config), AppsFlyer, ad mediation (AppLovin, Unity Ads), IAP (including Amazon Subscriptions)
- **Performance:** mobile optimization (draw calls, memory, build size, startup time); Unity Profiler, Memory Profiler, Frame Debugger

WORK EXPERIENCE

Independent projects

September 2025 - present

- Built an [HTML5 playable ad](#) in one week, my first time shipping to the web: 800 units on screen at 60 FPS on an Amazon Fire 7 (2019, 1 GB RAM), in 2.9 MB out of a 5 MB budget. One GameObject per unit only reached 10 FPS, so I baked the crowd into a vertex animation instead
- Built Memory Foyer and ChessOutline, detailed below

Unity Developer / Vira Games

July 2022 - September 2025 | Remote

Hyper-casual / hybrid-casual mobile game studio. Worked in one of several 3-person pods (game designer, artist, Unity developer) under a tech lead, producer, and art lead. Carried each title from first playable to store release.

Selected work:

- Shipped 16 titles in 38 months on Google Play and Amazon, every one running on a 1 GB Fire 7
- Built the editor tools the game designer worked in on almost every title: a level builder that cut colliders from ~50 to 5 per level, a branching dialogue editor, rope authoring, content generators
- Extended the studio's shared SDK for every team: AppsFlyer events, a CAS SDK upgrade, and a one-click Tenjin to AppsFlyer swap
- Rebuilt the biggest share of store builds when a policy change put the studio's entire catalogue back through compliance
- Made a title successful enough that the studio reskinned it twice, built one reskin and coached the other developer through the second
- Picked by the tech lead for the studio's VR hackathon, playable build in two weeks

Selected shipped titles (all 16 in my [portfolio](#)):

- [Jelly Merge](#) - Cube-merging puzzle with a Lego-style cube-building meta; 4.5 stars from 1,400+ ratings on Amazon
- [Squishy Octopus](#) - Obi Rope stretch mechanic with a custom level editor
- [Cowboy Shooter](#) - Western shooter with IK-driven animation and cover-based AI

PERSONAL PROJECTS

- [Memory Foyer](#) ([GitHub](#)) - Unity 6 spaced-repetition trainer (SM-2), built in three weeks. Five-layer architecture compile-enforced via .asmdef; Domain and Application are pure C# (no UnityEngine), covered by 12 EditMode test suites. VContainer, UniTask, MessagePipe; in-editor deck-authoring tool.
- [ChessOutline](#) ([GitHub](#)) - Chrome extension for visualising chess tactics (pins, forks, hanging pieces, square control).

EDUCATION

Bachelor's in Computer Engineering / Taras Shevchenko National University of Kyiv

2020 - 2024 | completed alongside the full-time role at Vira Games

LANGUAGES

Ukrainian (native) | English (B2)
